

ParisTech's Chair Modeling for sustainable development

Long-term planning tools and reliability needs: Focusing on the Reunion Island

Mathilde Drouineau¹ Nadia Maïzi¹ Edi Assoumou¹ Vincent Mazauric^{1,2}

¹Mines Paristech, Center for Applied Mathematics (France)

²Schneider Electric, Corporate Research Division (France)

33th IAEE International Conference (Rio de Janeiro, June 2010)

Power sectors: a period of changes

O Numerous challenges:

- Constraints on carbon emission
- Depletion of fossil fuels
- Population densification
- Forecast huge investments in power sectors
- Liberalization of electricity markets
- O The need to improve energy efficiency:
 - Electricity efficiency is severly disadvantaged by the efficiency of the Carnot cycles
- Solution Fossil fuels = 66% of the world net electricity production

In this context, renewable and distributed energy sources are attractive alternatives for power generation.

Spread of renewable and distributed energy sources

Benefits

The overall efficiency improves:

- Renewable energy sources decrease electrical losses at production level
- Distributed generation decrease electrical losses at transmission and distribution levels

2 High shares of renewable and distributed energy sources are expected:

- In centralized scheme, e.g. Desertec concept
- In distributed architecture with smartgrids concept

Spread of renewable and distributed energy sources

Challenges

Major technological issues

- Intermittency
- **Reliability of electricity supply**: the capability of the power system to withstand sudden disturbances

2 Design of energy policies

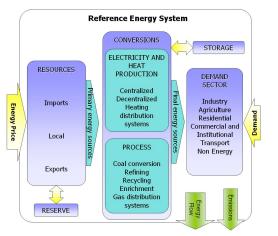

- To promote renewable and distributed sources
- Incentives' system

Why focusing on the Reunion Island ?

- Blessed with high renewable energy potentials
- Small, weakly-meshed and isolated power system
- Binding target in 2030: 100% renewable sources in power generation

Long-term planning tools: *the MARKAL/TIMES models*

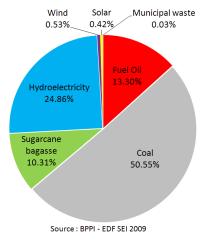

Inputs:

- Exogeneous demand
- Available technologies
- Domestic resources
- Energy prices

Outputs:

- Optimal technologies
- Optimal timing of investments
- Global cost
- Emissions
- Technological models driven by energy demand
- Minimization of the global discounted cost of the energy system

The electricity sector in 2008

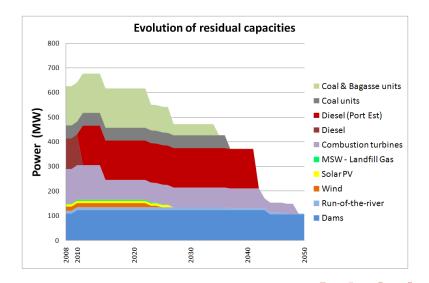

Electricity production: 2 546 GWh

Installed capacities Thermal units (76%): 476 MW Fuels: coal, fuel oil, sugarcane bagasse • Hydroelectricity (20%): Dams: 109,4 MW Run-of-the-river: 11,6 MW • Others (4%): Wind: 16.8 MW Solar PV: 10 MW Municipal Waste: 2 MW

æ

Scenarios specification

- Potentials for renewable energy sources are set at their maximum values.
- Scenarios are built around 3 assumptions

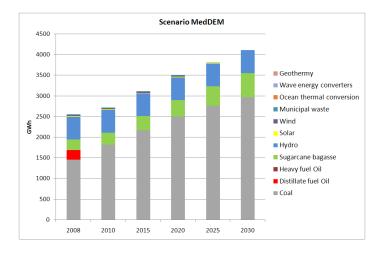

Fossil fuel imports{No limit
Limit on coal
Limit on all fossil fuelsDemand{Standard
LowSugarcane bagasse
potential{Standard
High

Results: calibration for the year of reference (2008)

Energy sources	Model (%)	EDF (%)
Coal	56.90	50.55
Fuel Oils (Distillate and Heavy)	9.06	13.30
Sugarcane bagasse	10.21	10.31
Hydroelectricity	21.71	24.86
Wind energy	1.19	0.53
Solar energy	0.41	0.42
Municipal waste	0.52	0.03
-		
Production	2 547 GWh	2 546 GWh

Rio de Janeiro 2010

∃ ► < ∃ ►</p>

Conclusion

- Renewable energy sources may cover power generation in 2030
- The model can be further developed: loadcurve, bagasse industry, scenario prices, carbon constraints
- Good case study to model technological and economical issues in TIMES models:
 - Reliability of electricity supply
 - Incentives' system
